## Personal information

---

**Full name:** Lucas Barrena

**Birthdate:** 22/07/1998

**Country:** Argentina

**Email:** lucasbarrena98@gmail.com

**WhatsApp:** +5493424235781

---

I **started developing at 13** years old and I continued because I like others to find my developments useful. I always go for more advanced topics and so I went **deeper into multiple programming languages**.

## Knowledge and achievements

---

**SourcePawn:** own library to **create neural networks** (unique on Pawn) and more contributions.

**PHP:** own framework MVC for easy developmenst, it was a long time ago, I'm not using PHP.

**HTML:** not much to add, it's simply HTML but you need to have good practices.

**CSS:** I made several own designs and mainly a lot of experience modifying templates.

**MySQL:** I learned from basic queries to **security, performance and optimization** issues.

**Java:** I use it occasionally when I do personal projects with Arduino or others.

**JavaScript:** an excellent language because it's everywhere so **it's my favorite**.

**Arduino:** **remote control lights, smart alarms, security implementations**, etc.

**Trello:** I usually organize with Trello for the simple and because we all know the platform.

**Node.js:** it was the best knowledge unification. I have **multiple very useful own libraries** in GitHub.

**MongoDB:** it seemed the standard among Node developers and so it is.

**Git:** any developer has to know how to use a version control system, it's not negotiable.

**Regex:** learning it **is extremely useful**, I solved many problems in this way.

**ReactJS:** I had my **own JS framework to handle the DOM** but React won, I always use it.

**SEO:** I understood that it's **essential for any web** and Google positioning so I learned about it.

**Linux:** +1 year ago I **switched to this operative system** and so it makes more sense to develop.

**Docker:** after learning to use it, there is no going back, it also helps you organize the project better.

**Go:** recently I **created and designed a genetic neural networks** library with higher performance.

## Contributions

---

I **like share** so it would not be strange to find my publications like:
